ABSTRACT:

PURPOSE: To enhance woody feel of decorated glued laminated wood by emitting fragrance of wood from the decorated glued laminated wood by a method wherein glued laminated wood and wood spirit are contained, and a surface is faced.

CONSTITUTION: Decorated glued laminated wood is equipped with a sealed resin layer 3 laminated on glued laminated wood 2, a printed layer 4 laminated on the sealed resin layer 3, and a colored resin layer 5 laminated on the printed layer 4. Further, the glued laminated wood 3 is provided wherein fiber directions of woody material 1 such as Japanese red pine or the like are made almost parallel with each other, and joined together by using an adhesive. The sealed resin layer 3 is formed by applying transparent or semitransparent resin coating containing lacquar surface or the like. The printed layer 4, when a wood-grained pattern is made by using transparent printing ink, increases woody feeling. The colored resin layer 5 is formed by painting repetitively a plurality of times by using transparent resin coating. Then, the decorated glued laminated wood, since the woody feel is increased by incorporating wood sprit such as hinokitiol or the like, is suitably used as building material and housing interior-finishing material.
